Case Report: *Candida guilliermondii* fungaemia and endophthalmitis in a patient with acute myeloid leukaemia

Saunte JP¹, Ia Cour M¹, Saunte DM², Arendrup MC²

1 Eye Dept., Glostrup Hospital, Copenhagen University, Copenhagen.
2 Unit of Mycology, Statens Serum Institut, Copenhagen.

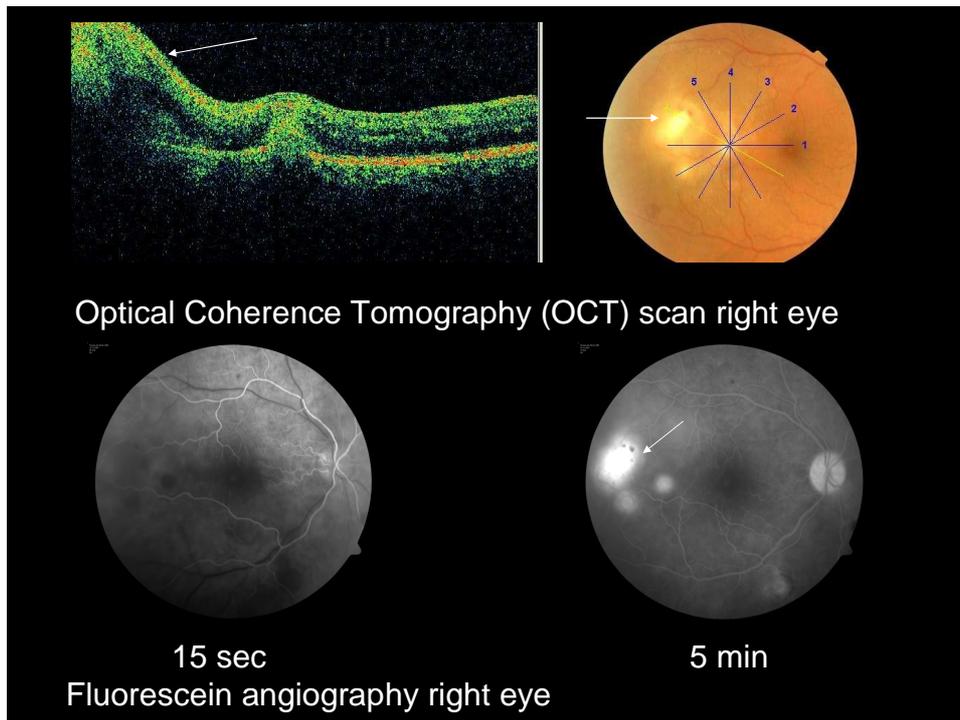

jonpeiter@saunte.com

51 year-old man
Acute myeloid leukemia
Pneumonia and blurred vision
ICU 3 different antibiotics and fluconazole
C. guilliermondii in two separate blood cultures
All tests for viral, parasite and bacterial infections were negative.

Right eye

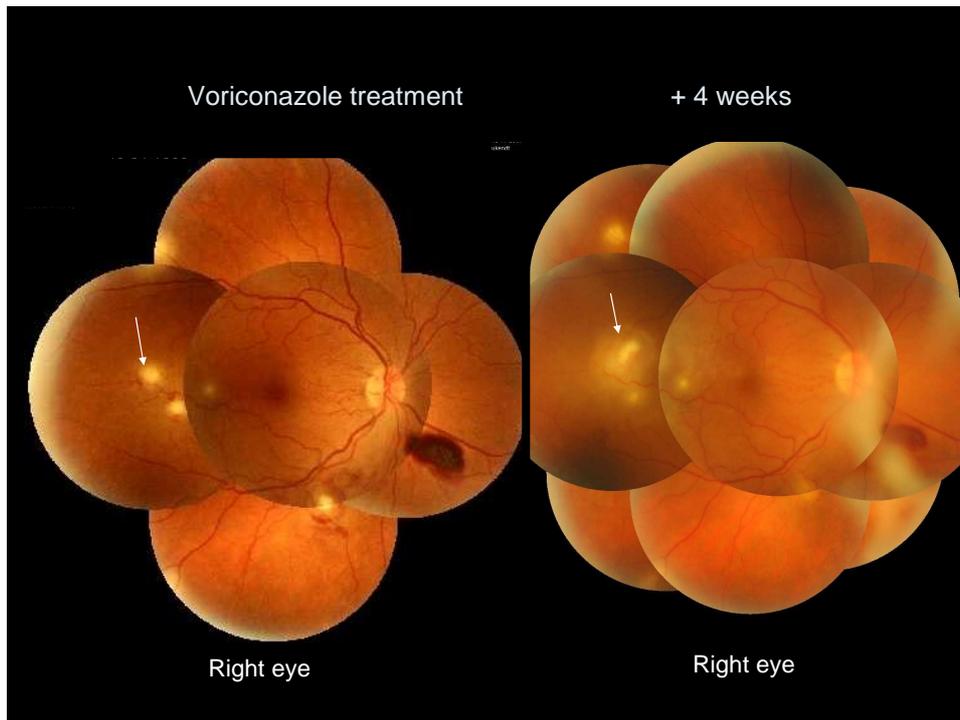

Left eye

Treatment

- Anti-bacterial &-viral
 - Aciclovir, Ciproxin, Vancomycin, Meronem, Bactrim (iv)
- Antifungal

– Fluconazole (iv)	prophylactic
– Amphotericin B + 5 flucytosine (iv)	4 weeks
– Voriconazole 800 mg (po)	4 days
– Voriconazole 400 mg (po)	4 weeks

	<u>Fluconazole</u>	<u>itraconazole</u>	<u>voriconazole</u>	<u>Caspofungin</u>	<u>Amphotericin</u>
MIC	>16	0.125	0.25	1	0.048
SIR	R	S	I	S	S
BP	2/4	0,125/0,5	0,125/NE	2/NE	1/NE

Breakpoints are indicated as S≤X / R>Y. NE indicates Not Established.

- Serum concentration voriconazole: 0,92 µg/ml (therapeutic level: 1-6 µg/ml).

Vitrectomy

Praktisk Oftalmologi

Candida endophthalmitis:

Vitrectomy

amphotericin injection both eyes

Iv amphotericin B + 5 flucytosine

Conclusion

Fungaemia due to *C. guilliermondii* is rare.

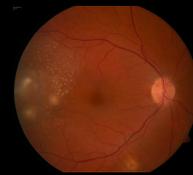

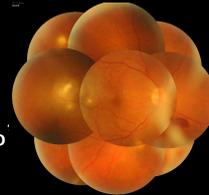

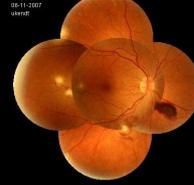

Blood isolates in Denmark 2004-7 (n=1562):

- *C. guilliermondii* (n=13) 0.8%
 - Fluconazole MIC >16 µg/ml 2
 - Voriconazole MIC >0.125 µg/ml 3

Voriconazole penetration (blood Brain/eye) 46%

Endophthalmitis:

- Repeated fundus photos
- Species identification
- Susceptibility testing
- Drug level monitoring
- Vitrectomy
